Electrical Stimulation of the Spine as an Adjunct to Spinal Fusion Procedures

Description

Both invasive and noninvasive electrical bone growth stimulators have been investigated as an adjunct to spinal fusion surgery, with or without associated instrumentation, to enhance the probability of obtaining a solid spinal fusion. Noninvasive devices have also been investigated in patients who are at normal risk of failed fusion and to treat a failed fusion.

OBJECTIVE

The objective of this evidence review is to determine whether the use of electrical bone growth stimulation improves bone fusion rates in individuals at risk for spinal fusion failure.

POLICY STATEMENT

Either invasive or noninvasive methods of electrical bone growth stimulation may be considered medically necessary as an adjunct to lumbar spinal fusion surgery in patients at high risk for fusion failure, defined as any one of the following criteria:

- one or more previous failed spinal fusion(s);
- grade 3 or worse spondylolisthesis;
- fusion to be performed at more than 1 level;
- current tobacco use;
- diabetes;
- renal disease;
- alcoholism; or
- steroid use.

Noninvasive electrical bone growth stimulation may be considered medically necessary as a treatment for patients with failed lumbar spinal fusion surgery. Failed spinal fusion is defined as a spinal fusion that has not healed at a minimum of 6 months after the original surgery, as evidenced by serial radiographs over a course of 3 months.

Semi-invasive electrical bone growth stimulation is considered investigational as an adjunct to lumbar spinal fusion surgery and for failed lumbar fusion.

Invasive, semi-invasive, and noninvasive electrical bone growth stimulation are considered not medically necessary as an adjunct to cervical fusion surgery and for failed cervical spine fusion.

BENEFIT APPLICATION

Experimental or investigational procedures, treatments, drugs, or devices are not covered (See General Exclusion Section of brochure).

While invasive electrical stimulation will be billed as a component of the hospital charge, noninvasive devices may be adjudicated according to the benefits for durable medical equipment.

FDA REGULATORY STATUS

The following implantable device was approved by the U.S. Food and Drug Administration (FDA) through the premarket approval process:

- In 1986, the OsteoStim (Electro-Biology), which may also be marketed under the trade name SPF (Biomet).
- The following noninvasive bone growth stimulators have been approved by the FDA through the premarket approval process:
  - In 1999, the SpinalPak bone growth stimulator system (Biolectron, a subsidiary of Electro-Biology), a capacitive coupling system, was approved for use as an adjunct to primary lumbar spinal fusion at 1 or 2 levels.

The policies contained in the FEP Medical Policy Manual are developed to assist in administering contractual benefits and do not constitute medical advice. They are not intended to replace or substitute for the independent medical judgment of a practitioner or other health care professional in the treatment of an individual member. The Blue Cross and Blue Shield Association does not intend by the FEP Medical Policy Manual, or by any particular medical policy, to recommend, advocate, encourage or discourage any particular medical technologies. Medical decisions relative to medical technologies are to be made strictly by members/patients in consultation with their health care providers. The conclusion that a particular service or supply is medically necessary does not constitute a representation or warranty that the Blue Cross and Blue Shield Service Benefit Plan covers (or pays for) this service or supply for a particular member.
In 1979, the EBI Bone Healing System (Bioelectrotron, a subsidiary of Electro-Biology), a pulsed electromagnetic field system, was approved for nonunions, failed fusions, and congenital pseudarthroses. The device is secured with a belt around the waist.

In 1994, the Spinal-Logic Bone Growth Stimulator (Regenetics, a division of d) Orthopedics [formerly OrthoLogic]) was approved as a combined magnetic field portable device. This device is secured with a belt around the waist.

In 1996, the Spinal-Logic Lite (Orthofix) was approved as a spinal adjunct to the Physio-Stim. The Spinal-Logic Lite device was approved to increase the probability of fusion success and as a nonoperative treatment for the salvage of failed spinal fusion, where a minimum of nine months has elapsed since the last surgery.

In 2004, the Stim (Orthofix), a pulsed electromagnetic field system, was approved as an adjunct to cervical fusion surgery in patients at high-risk for nonfusion.

No non-invasive electrical bone growth stimulator devices were identified with the FDA approval or clearance.

FDA product codes: LOE (invasive bone growth stimulator), LOF (noninvasive bone growth stimulator).

**Rationale**

**Summary of Evidence**

For individuals who are at high-risk of lumbar spinal fusion surgery failure who receive invasive or noninvasive electrical bone growth stimulation, the evidence includes systematic reviews, a TEC Assessment, and RCTs. The relevant outcomes are symptoms, change in disease status, and functional outcomes. Results from these trials have indicated that in patients with risk factors for failed fusion surgery, either invasive or noninvasive electrical bone stimulation increases the fusion rate. The evidence is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.

For individuals who have failed lumbar spinal fusion surgery who receive noninvasive electrical bone growth stimulation, the evidence includes a TEC Assessment and studies with patients serving as their own controls. The relevant outcomes are symptoms, change in disease status, and functional outcomes. Data have shown that noninvasive electrical stimulation improves fusion rates in this population. The evidence is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.

For individuals who are undergoing cervical spinal fusion surgery or have failed cervical spine fusion who receive invasive or noninvasive electrical bone growth stimulation, the evidence includes an RCT. The relevant outcomes are symptoms, change in disease status, and functional outcomes. The only controlled trial published to date had methodologic limitations, and the efficacy of electrical stimulation in the cervical spine has not been established. An open-label multicenter cohort study provided evidence to demonstrate that patients at high-risk for arthrodesis following anterior cervical disectomy and fusion procedures reported statistically significant improvements in fusion rates with pulsed electromagnetic field stimulation. However, limitations in the study design, including use of a historical control group, lack of blinding, and no restrictions on surgical methods used by surgeons, preclude definitive assessments of treatment efficacy. The evidence is insufficient to determine the effects of the technology on health outcomes.

**Supplemental Information**

**Practice Guidelines and Position Statements**

**North American Spine Society**

The North American Spine Society (2016) issued a coverage recommendation for electrical bone growth stimulators, which stated the following:

1. "For augmentation of spinal fusion in any and all regions of the spine including occipital-cervical, cervical, cervicothoracic, thoracic, thoracolumbar, lumbar and lumbosacral spinal regions in patients at high-risk for the development of pseudarthrosis (ie, nonunion) who exhibit one or more of the following:
   1. Are undergoing spinal fusion of two or more motion segments (3 vertebrae)
   2. Are undergoing a revision spinal fusion (eg, repeat surgery for a previously unhealed fusion attempt)
   3. Are smokers who cannot stop smoking in preparation for fusion due to the nature of the underlying condition (eg, acute traumatic fracture)
   4. Exhibit one or more of the following comorbidities when undergoing primary lumbar fusion:
      1. Diabetes
      2. Inflammatory arthritis (eg, rheumatoid arthritis) that has required long-term corticosteroid therapy
      3. Immunosuppressed (eg, undergoing chemotherapy and radiation therapy to the spine, hypogammaglobulinemia, granulocytopenia, acquired immune deficiency syndrome, chronic granulomatous disease)
      4. Systemic vascular disease
   5. Osteopenia or osteoporosis"

2. In the lumbar regions, varying forms of electrical stimulation are indicated in high-risk patients with the specific techniques outlined. In all other regions of the spine, coverage for the same indications is recommended although there is less supporting evidence.

   1. DCS [direct current stimulation: electrodes implanted within or very close to the location of the desired fusion] and CCS [capacitance coupling stimulation; 2 electrodes placed on the skin over the fusion site] for posterolateral fusion using autograft and extenders
   2. PEMFS [pulsed electromagnetic: coils that produce a time-varying magnetic field around the area of the desired fusion] for lumbar interbody fusion."

**American Association of Neurological Surgeons and Congress of Neurological Surgeons**

Updated guidelines from the American Association of Neurological Surgeons and the Congress of Neurological Surgeons (2014) indicated that there was no evidence published after their 2005 guidelines that conflicts with the previous recommendations on bone growth stimulation. Based on a single-level II study (2009), the routine use of direct current stimulation in patients older than age 60 years of age, based on level III and IV studies showing a positive impact on fusion rate. However, concerns about the level III study were that it was a poorly designed and poorly conducted cohort study consisting of an exceedingly small heterogeneous population of patients, and the overall recommendation was level C. There was insufficient evidence to recommend for or against the use of pulsed electromagnetic field stimulation as a treatment alternative to revision surgery in patients presenting with pseudarthrosis following posterolateral lumbar fusion (single-level IV study).

The 2 medical associations also issued guidelines in 2005 that stated there was class II and III evidence (nonrandomized comparative trials and case series):

"...to support the use of direct current stimulation [capacitive coupled stimulation] for enhancing fusion rates in high-risk patients undergoing lumbar PLF. A beneficial effect on fusion rates in patients not at <61-high-risk> has not been convincingly demonstrated, nor has an effect been shown for those patients treated with interbody fusion. There is limited evidence both for and against the use of PEMFS for enhancing fusion rates following PLF. Class II and III medical evidence supports the use of PEMFS for promoting arthrodesis following interbody fusion. Although some studies have purported to demonstrate functional improvement in some patient subgroups, other studies have not detected differences. All of the reviewed studies are subject to the use of the usage or discourage any particular medical technologies. Medical decisions relative to medical technologies are to be made strictly by members/patients in consultation with their health care providers. The conclusion that a particular service or supply is medically necessary does not constitute a representation or warranty that the Blue Cross and Blue Shield Service Benefit Plan covers (or pays for) this service or supply for a particular member.

**U.S. Preventive Services Task Force Recommendations**

Not applicable.

The policies contained in the FEP Medical Policy Manual are developed to assist in administering contractual benefits and do not constitute medical advice. They are not intended to replace or substitute for the independent medical judgment of a practitioner or other health care professional in the treatment of an individual member. The Blue Cross and Blue Shield Association does not intend by the FEP Medical Policy Manual, or by any particular medical policy, to recommend, advocate, encourage or discourage any particular medical technologies. Medical decisions relative to medical technologies are to be made strictly by members/patients in consultation with their health care providers. The conclusion that a particular service or supply is medically necessary does not constitute a representation or warranty that the Blue Cross and Blue Shield Service Benefit Plan covers (or pays for) this service or supply for a particular member.
Medicare National Coverage

Medicare covers noninvasive electrical stimulators for the following:

- Failed fusion, where a minimum of 9 months has elapsed since the last surgery and
  - "...as an adjunct to spinal fusion surgery for patients at high risk of pseudoarthrosis due to previously failed spinal fusion at the same site or for those undergoing multiple level
  fusion. A multiple level fusion involves 3 or more vertebrae (e.g., L3-L5, L4-S1, etc.)."
- Medicare covers invasive electrical stimulators:
  - "...as an adjunct to spinal fusion surgery for patients at high risk of pseudoarthrosis due to previously failed spinal fusion at the same site or for those undergoing multiple level
  fusion. A multiple level fusion involves 3 or more vertebrae (e.g., L3-L5, L4-S1, etc.)."
