Botox

Description

Botox (onabotulinum toxin A)

Background
Botulinum toxin (abbreviated either as BTX or BoNT) is a protein neurotoxin produced by the bacterium *Clostridium botulinum*. The botulinum toxins are characterized as 7 separate neurotoxins (labeled as types A, B, C [C1, C2], D, E, F, and G), which are antigenically and serologically distinct but structurally similar. The neuromuscular blockade is achieved through prevention of docking/fusion of neurosecretory with the nerve synapse plasma membrane and release of neurotransmitters (1).

The various botulinum toxins have approved cosmetic and non-aesthetic uses. They possess individual potencies, and care is required to assure proper use and avoid medication errors. Recent changes to the established drug names by the FDA were intended to reinforce these differences and prevent medication errors (1-2).

Regulatory Status
FDA-approved indications: Botox is an acetylcholine release inhibitor and a neuromuscular blocking agent indicated for: (3)

1. Treatment of overactive bladder (OAB) with symptoms of urge urinary incontinence, urgency, and frequency, in adults who have an inadequate response to or are intolerant of an anticholinergic medication

2. Treatment of urinary incontinence due to detrusor over-activity associated with a neurologic condition [e.g., spinal cord injury (SCI), multiple sclerosis (MS)] in adults who have an inadequate response to or are intolerant of an anticholinergic medication.
3. Prophylaxis of headaches in adult patients with chronic migraine (≥15 days per month with headache lasting 4 hours a day or longer).
4. Treatment of upper or lower limb spasticity in adult patients.
5. Treatment of cervical dystonia in adult patients, to reduce the severity of abnormal head position and neck pain.
6. Treatment of severe axillary hyperhidrosis that is inadequately managed by topical agents in adult patients.
7. Treatment of blepharospasm associated with dystonia in patients ≥12 years of age.
8. Treatment of strabismus in patients ≥12 years of age.

Limitations of Use:
Safety and effectiveness of Botox have not been established for the prophylaxis of episodic migraine (14 headache days or fewer per month) (3).

Off-Label Uses: (4-11)
1. Achalasia
2. Chronic anal fissures
3. Essential tremor
4. Excessive salivation secondary to advanced Parkinson’s disease
5. Hemifacial spasm
6. Spasmodic dysphonia (laryngeal dystonia)

Safety and effectiveness of Botox have not been established for the treatment of upper limb spasticity in pediatric patients, and for the treatment of lower limb spasticity in adult and pediatric patients (3).

Safety and effectiveness of Botox have not been established for the treatment of hyperhidrosis in body areas other than axillary (4).

Botulinum toxins are not interchangeable. Total accumulated dose should not exceed 400 IU over a 3 month interval (3).

Some products have cosmetic indications which are excluded from coverage.

Policy

This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Botox may be considered medically necessary for treatment of the conditions indicated below.

Botox may be considered investigational for all other indications.

Prior – Approval Requirements

Age

No age restriction

Diagnosis

Patient must have the following:

1. Upper and/or lower limb spasticity

Age

12 years of age or older

Diagnoses

Patient must have ONE of the following:

1. Blepharospasm associated with dystonia
2. Strabismus

Age

18 years of age or older

Diagnoses

Patient must have ONE of the following:

A. Spasticity disorders
   1. Hereditary spastic paraplegia
   2. Spastic hemiplegia
3. Hemifacial spasms
4. Spasmodic torticollis (clonic twisting of the head)
5. Facial Nerve (VII) disorders
6. Neuromyelitis optica

B. Movement disorders
   1. Dystonia
      a. Cervical
      b. Writer's cramp
      c. Focal task specific
      d. Laryngeal (spasmodic dysphonia)
   2. Essential Tremor
   3. Orofacial dyskinesia

C. GI/ Sphincter disorders
   1. Achalasia
   2. Chronic anal fissures
   3. Dysphagia
   4. Sphincter of Oddi dysfunction
   5. Excessive Salivation
      a. Due to Parkinson’s disease

D. Bladder
   1. Overactive bladder (OAB)
      a. Inadequate response or intolerance to an anticholinergic
   2. Incontinence associated with a neurologic condition (spinal cord injury, multiple sclerosis, etc)
      a. Inadequate response or intolerance to an anticholinergic

E. Other Indications
   1. Hyperhidrosis
   2. Prophylaxis of chronic migraine headaches
      a. Patient is experiencing ≥15 days per month with headache lasting 4 hours a day or longer
      b. Patient has completed an adequate trial (≥ 8 weeks) of at least ONE of the following
         i. Divalproex Sodium (Depakote, Depakote ER)
Section: Prescription Drugs
Subsection: Neuromuscular Drugs
Subject: Botox

Prior – Approval Renewal Requirements

**Age**
No age restriction

**Diagnosis**
Patient must have the following:

1. Upper and/or lower limb spasticity

**Age**
12 years of age or older

**Diagnoses**
Patient must have **ONE** of the following:

1. Blepharospasm associated with dystonia
2. Strabismus

**Age**
18 years of age or older

---

ii. Topiramate (Topamax)
iii. Gabapentin (Neurontin)
iv. Amitriptyline (Elavil)
v. Venlafaxine (Effexor)
vi. Beta-Blockers: Atenolol/Metoprolol/Propranolol/Timolol/Nadolol
vii. Nimodipine/Verapamil
viii. Naproxen/other NSAID
ix. Other oral migraine prophylactic therapy considered to be appropriate by the requesting physician

**c. NO dual therapy with a calcitonin gene-related peptide (CGRP) antagonist**

**AND** the following:
1. **NO** dual therapy with other botulinum toxins
Diagnoses

Patient must have **ONE** of the following:

A. **Spasticity disorders**
   1. Hereditary spastic paraplegia
   2. Spastic hemiplegia
   3. Hemifacial spasms
   4. Spasmodic torticollis (clonic twisting of the head)
   5. Facial Nerve (VII) disorders
   6. Neuromyelitis optica

B. **Movement disorders**
   1. Dystonia
      a. Cervical
      b. Writer’s cramp
      c. Focal task specific
      d. Laryngeal (spasmodic dysphonia)
   2. Essential Tremor
   3. Orofacial dyskinesia

C. **GI/ Sphincter disorders**
   1. Achalasia
   2. Chronic anal fissures
   3. Dysphagia
   4. Sphincter of Oddi dysfunction
   5. Excessive Salivation
      a. Due to Parkinson’s disease

D. **Bladder**
   1. Overactive bladder (OAB)
   2. Incontinence associated with a neurologic condition (spinal cord injury, multiple sclerosis, etc)

E. **Other Indications**
   1. Hyperhidrosis
   2. Prophylaxis of chronic migraine headaches
a. Response to therapy has shown a 50% reduction in monthly migraine frequency since starting therapy with Botox
b. NO dual therapy with a calcitonin gene-related peptide (CGRP) antagonist

AND the following:

a. NO dual therapy with other botulinum toxins

Rationale

Summary
Botulinum toxin (abbreviated either as BTX or BoNT) is a protein neurotoxin produced by the bacterium Clotridium botulinum. The botulinum toxins are characterized as 7 separate neurotoxins (labeled as types A, B, C [C1, C2], D, E, F, and G), which are antigenically and serologically distinct but structurally similar (3).
The various botulinum toxins have approved cosmetic and non-aesthetic uses. They possess individual potencies, and care is required to assure proper use and avoid medication errors. Recent changes to the established drug names by the FDA were intended to reinforce these differences and prevent medication errors (1-2).

Prior authorization is required to ensure the safe, clinically appropriate and cost effective use of Botox while maintaining optimal therapeutic outcomes.

References
BOTOX (onabotulinumtoxinA) for injection is indicated for the treatment of upper limb spasticity in adult patients, to decrease the severity of increased muscle tone in elbow flexors (biceps), wrist flexors (flexor carpi radialis and flexor carpi ulnaris) and finger flexors (flexor digitorum profundus and flexor digitorum sublimis). The efficacy and safety of BOTOX for the treatment of upper limb spasticity were evaluated in three randomized, multi-center, double-blind, placebo-controlled studies. Safety and effectiveness of BOTOX have not been established for the treatment of upper limb spasticity in pediatric patients, and for the treatment of lower limb spasticity in adult and pediatric patients.
